

InventoryPlus — Dashboard Integration Report

Date: June 29, 2026

A formal summary of the files created, logic cleanups implemented, and browser verification completed during the integration of the premium Dashboard view.

1. Accomplishments & Work Done

To support real-time resource tracking and a high-fidelity visual experience, we designed and integrated the new Dashboard page view into the React frontend.

- **Created Dashboard.tsx:** Built a premium component file at `src/components/Dashboard.tsx` containing state filters, charts, and member lists.
- **Simplified App.tsx View States:** Removed redundant indexes and established `isDashboardView = activeIndex === 2`.
- **Wired Render Trees:** Replaced placeholders with the actual `<Dashboard />` view.

2. Finalized App.tsx Routing Code

```
// In App.tsx
return (
  <main className={`app-main ${showRightSidebar ? 'sidebar-open' : ''}`}>
    {isInventoryView ? (
      <Inventory ... />
    ) : isDashboardView ? (
      <Dashboard />
    ) : (
      <div className="placeholder-view">...</div>
    )}
  </main>
);
```
