

InventoryPlus — Dashboard Integration Report

Date: June 29, 2026

A formal summary of the files created, logic cleanups implemented, and browser verification completed during the integration of the premium Dashboard view.

1. Accomplishments & Work Done

To support real-time resource tracking and a high-fidelity visual experience, we designed and integrated the new Dashboard page view into the React frontend. Below is the breakdown of what has been accomplished:

- **Created Dashboard.tsx:** Built a premium component file at `src/components/Dashboard.tsx` matching the requested UI design mock. It includes live state filter bindings, custom-themed charts, activity grids, and a sidebar member directory.
- **Simplified App.tsx View States:** Removed the redundant conditional check under index 0 and established a clean Boolean condition: `const isDashboardView = activeIndex === 2;`
- **Wired Render Trees:** Replaced the old placeholder rendering layout in `App.tsx` with a clean import and instantiation of `<Dashboard />` under the `isDashboardView` branch.
- **Browser Verification:** Loaded the site via the local server port 5173, verified click handlers, checked layout flow compatibility, and confirmed that search filtering operates smoothly.

2. Updated Component Structure

File Name	Role / Purpose	Status
<code>src/components/Dashboard.tsx</code>	Renders asset statistics, filter inputs, status donuts, activity feed, and team members list.	Created [NEW]
<code>src/App.tsx</code>	Acts as the view manager, imports and triggers <code><Dashboard /></code> on sidebar index 2.	Modified [UPDATED]
<code>src/components/Inventory.tsx</code>	Renders department grids and active workstation detail blocks.	Active [UNTOUCHED]

3. Finalized App.tsx Routing Code

Here is the clean rendering section in src/App.tsx executing the view selection:

```
return (
  <div className="app-layout">
    <SidebarNavigationSlimDemo
      activeIndex={activeIndex}
      onItemSelect={handleItemSelect}
      activeSub={activeSub}
      onSubSelect={handleSubSelect}
    />
    <main className={`app-main ${showRightSidebar ? 'sidebar-open' : ''}`}>
      {isInventoryView ? (
        <Inventory
          key={resetKey}
          showRightSidebar={showRightSidebar}
          setShowRightSidebar={setShowRightSidebar}
        />
      ) : isDashboardView ? (
        <Dashboard />
      ) : (
        <div className="placeholder-view">
          <h2>{getCurrentViewName()} View</h2>
          <p>This section is currently under development...</p>
        </div>
      )}
    </main>
  </div>
);
```
