

# InventoryPlus — Dashboard Modularization & Sidebar Report

Date: June 30, 2026

A formal report detailing the extraction of components from the monolithic Dashboard, integration of the shared RightSidebar component, and local state synchronizations completed today.

## 1. Accomplishments & Work Done Today

We successfully restructured the Dashboard component from a single monolithic file into a modular architecture mirroring the Inventory pattern, and wired up the shared layout components. Below is the summary:

- **Extracted Dashboard Display Components:** Moved rendering logic into independent files inside `src/shared/dashboard/components/`: `MetricsCards.tsx`, `AssetTable.tsx`, `DonutChart.tsx`, and `RecentActivity.tsx`.
- **Integrated Shared RightSidebar:** Removed the local `PeopleSidebar` panel. Substituted it with the system-wide `RightSidebar` from `src/features/navigation/RightSidebar`.
- **Connected Sidebar Toggle & Selection:** Linked the `People` sidebar's open state to `showRightSidebar` and `setShowRightSidebar` managed in `App.tsx`. Added a toggle button to the Dashboard header and tracked list selection via a new local index state.
- **Committed & Pushed:** Verified the app build locally and pushed all modified files and the untracked modularized files to the remote dashboard branch.

## 2. Updated Modular Architecture

The Dashboard now acts as a thin composition layer coordinating the following components:

| File / Path                                                 | Purpose / Role                                                                     | Status               |
|-------------------------------------------------------------|------------------------------------------------------------------------------------|----------------------|
| <code>src/components/Dashboard.tsx</code>                   | Thin layout container composing cards, assets list, and right sidebar.             | Refactored [UPDATED] |
| <code>shared/dashboard/components/AssetTable.tsx</code>     | Self-contained table component handling asset listings, filtering, and pagination. | Created [NEW]        |
| <code>shared/dashboard/components/MetricsCards.tsx</code>   | Top row rendering key performance counts (Active, Maintenance, Retired).           | Created [NEW]        |
| <code>shared/dashboard/components/DonutChart.tsx</code>     | Reusable chart component rendering conic-gradients for status/categories.          | Created [NEW]        |
| <code>shared/dashboard/components/RecentActivity.tsx</code> | Visual timeline rendering system update feeds and logs.                            | Created [NEW]        |
| <code>src/features/navigation/RightSidebar.tsx</code>       | Shared system sidebar component showing member details and navigation lists.       | Integrated [REUSED]  |

### 3. Sidebar State Integration Logic

The right-hand People sidebar now connects to the shared RightSidebar. Let's look at the implementation inside the Dashboard:

```
// In src/components/Dashboard.tsx
const PEOPLE_ITEMS = [
  "Emma Johnson (emma.johnson@example.com)",
  "Liam Smith (liam.smith@example.com)",
  // ...
];

export default function Dashboard({ showRightSidebar, setShowRightSidebar }: DashboardProps) {
  const [selectedPersonIndex, setSelectedPersonIndex] = useState<number>(-1);

  return (
    <div className="flex flex-col lg:flex-row gap-6 p-6 w-full...">
      <div className="flex-1 flex flex-col gap-6">
        {/* Header Toggle Button */}
        <button onClick={() => setShowRightSidebar(!showRightSidebar)}>
          {showRightSidebar ? 'Hide People' : 'Show People'}
        </button>
        {/* Metrics, Tables, and Charts */}
      </div>

      <RightSidebar
        isOpen={showRightSidebar}
        title="People"
        items={PEOPLE_ITEMS}
        onClose={() => {
          setShowRightSidebar(false);
          setSelectedPersonIndex(-1);
        }}
        initialSelectedIndex={selectedPersonIndex}
        onItemSelect={(_name, index) => setSelectedPersonIndex(index)}
      />
    </div>
  );
}
```

This aligns the Dashboard's RightSidebar behavior exactly with the Department view, giving the entire site a uniform look, animated spring transitions, and a clean selected item highlight state.
